

ZMEDIAGE • QR BOX CAMPAIGN

Setup guide

How to put the website live on Vercel and collect enquiries in a Google Sheet. About 20 minutes, no coding needed.

What's in the zip

File / folder	What it is
<code>zmediage-qr-campaign/</code>	The website. This folder goes to Vercel.
<code>print/qr-b.svg</code>	The QR code for the box. It opens https://zmediage.vercel.app . Send this file to the printer.
<code>src/config/campaign.ts</code>	Every word on the website. Edit text here.
<code>Zmediage-QR-Setup-Guide.pdf</code>	This guide.

How the website works

Someone scans the QR on the box. A short story opens on their phone (like Instagram stories) that introduces Zmediage. At the end there is a small form: name, WhatsApp or email, and what they need. Every form submission becomes a new row in your Google Sheet.

⚠ The most important rule

The QR code is printed with the address **zmediage.vercel.app**. Always update the **existing** Vercel project called **zmediage**. Do **not** create a new project with a different name, or the address changes and the printed QR stops working.

Do the steps in this order:

1. **Part A:** Create the Google Sheet (gives you a link)
2. **Part B:** Put the website live on Vercel and paste that link in
3. **Part C:** Test everything before printing

Part A: Google Sheet for enquiries

A1. Create the sheet

1. Go to **sheets.google.com** and log in with the company Google account (e.g. the info@zmediage.com account).
2. Click **Blank spreadsheet**.
3. Name it **Zmediage QR Enquiries** (top-left).

You don't need to add column headings. The script adds them automatically on the first enquiry.

A2. Add the script

1. In the sheet menu, click **Extensions → Apps Script**. A new tab opens.
2. Delete everything in the code box.
3. Copy and paste **exactly** this:

```
function doPost(e) {  
  const d = JSON.parse(e.postData.contents);  
  const sh = SpreadsheetApp.getActiveSpreadsheet().getSheets()[0];  
  if (sh.getLastRow() === 0) {  
    sh.appendRow(['Date & time', 'Name', 'Email', 'Phone / WhatsApp',  
                 'Interested in', 'Note', 'Page', 'Device']);  
  }  
  sh.appendRow([new Date(d.at), d.name, d.email, d.phone,  
               d.needs, d.message, d.source, d.ua]);  
  return ContentService.createTextOutput('ok');  
}
```

4. Click the  **Save** icon. If it asks for a project name, type **QR enquiries**.

A3. Publish the script and copy the link

1. Click the blue **Deploy** button (top-right) → **New deployment**.
2. Click the  gear next to "Select type" → choose **Web app**.
3. Fill in:
 - Description: **QR enquiries**
 - Execute as: **Me**
 - Who has access: **Anyone** (this is required, or the website can't add rows)
4. Click **Deploy**.
5. Google asks for permission. Click **Authorize access** and choose your account.
If you see *"Google hasn't verified this app"*, click **Advanced** → **Go to QR enquiries (unsafe)** → **Allow**. This is normal because it's your own script.

6. Copy the **Web app URL**. It looks like

`https://script.google.com/macros/s/AKfy...long_code.../exec`

Keep this link safe

Paste it into a note for now. You'll need it in Part B. Don't share it publicly.

A4. Get an email for every new enquiry (recommended)

1. Go back to the sheet tab.
2. Click **Tools** → **Notification settings** → **Edit notifications**.
3. Choose **Any changes are made** and **Email — right away**. Click **Save**.

Now you get an email whenever someone fills the form.

Part B: Put the website live on Vercel

Pick the option that matches how your **zmediage** project is set up on Vercel. If you're not sure, open **vercel.com** → project **zmediage** → **Settings** → **Git**. If a GitHub repository is shown, use Option 1. Otherwise use Option 2.

Option 1: The project is connected to GitHub (easiest)

1. Open the GitHub repository that's connected to the **zmediage** project.
2. Replace **all** the old files with the files from the `zmediage-qr-campaign` folder in the zip:
 - On GitHub: delete the old files, then **Add file** → **Upload files** and drag in everything from the folder (including the `api`, `public`, `src`, `print` and `scripts` folders).
 - Or, if you use Git on a computer: copy the files into the repo folder, then commit and push.
3. Vercel builds the new version by itself in about 1 minute. You can watch it under **Deployments**.

Option 2: No GitHub (upload from a computer)

You need a computer with **Node.js** installed (download the "LTS" version from **nodejs.org**).

1. Unzip the file. Open **Terminal** (Mac) or **Command Prompt** (Windows) inside the `zmediage-qr-campaign` folder.
2. Run these commands one by one:

```
npm install
npx vercel login
npx vercel link
npx vercel --prod
```

3. For `vercel login`, log in with the account that owns the zmediage project.

- For `vercel link`, answer **Yes** to "Link to existing project?" and pick **zmediage**. **Do not** create a new project.
- When `vercel --prod` finishes, it shows the live link.

B2. Build settings (check once)

Vercel usually detects these automatically. To check: **Project** → **Settings** → **Build and Deployment**.

Setting	Value
Framework Preset	Vite
Build Command	<code>npm run build</code>
Output Directory	<code>dist</code>
Install Command	<code>npm install</code>
Root Directory	the folder that contains <code>package.json</code>

B3. Connect the Google Sheet

- In Vercel open the **zmediage** project → **Settings** → **Environment Variables**.
- Add a new variable:

Key (Name)	Value	Environments
<code>LEAD_SHEET_WEBHOOK</code>	the Web app URL from step A3 (ends with <code>/exec</code>)	Production (and Preview)

- Click **Save**.
- Redeploy** so the change takes effect: go to **Deployments**, click **...** on the newest one → **Redeploy**.

Spell it exactly

The key must be `LEAD_SHEET_WEBHOOK`: all capitals, with underscores. A typo means enquiries won't reach the sheet.

Part C: Test before printing

- On your phone, open <https://zmediage.vercel.app>. The story should start with *"Hey, you. You just scanned a walking box."*
- Tap through all the cards. Tap right for next, tap left for back, and press and hold to pause.
- On the last card, fill the form with test details, e.g. name **TEST**, and tap **Get in touch**. You should see *"Thanks, TEST."*

4. Open the Google Sheet. A new row with your test should appear within a few seconds (plus an email, if you did A4).
5. Delete the test row.
6. Open `print/qr-b.svg` on a laptop screen and scan it with 2—3 different phones (an iPhone and an older Android too). Each should open `zmediage.vercel.app`.
7. Scan the printer's **proof** before the full print run.

✅ **All good when:**

the story plays, the form shows "Thanks", the row appears in the sheet, and the QR opens the site on every phone you try.

Printing the QR

- Send `print/qr-b.svg` to the printer. It's a vector file, so it stays sharp at any size.
- Recommended size on the box: **at least 30 × 30 cm**. Bigger scans from further away.
- Use a **matte** finish, not glossy, because shiny prints reflect mall lights and phones can't read them.
- Keep the white border around the QR. Don't crop it or place it on a coloured background.

If something goes wrong

Problem	Fix
The form says <i>"Our inbox is having a moment"</i> and offers WhatsApp	The sheet link isn't set up. Check step B3: the key name, that the value ends in <code>/exec</code> , and that you redeployed after saving.
Form says thanks, but no row in the sheet	In the Apps Script deployment, Who has access must be Anyone . Fix it under Deploy → Manage deployments → Edit .
You changed the Apps Script code later	Changes only go live after Deploy → Manage deployments → Edit → Version: New version → Deploy . The link stays the same.
<code>zmediage.vercel.app</code> still shows the old website	Check Deployments in Vercel. The newest deployment must say Ready and Production . Try a private/incognito browser window.
The build fails on Vercel	Check the B2 settings. The Root Directory must be the folder with <code>package.json</code> in it.
You want to change any text	Edit <code>src/config/campaign.ts</code> , then upload or push again (Part B).

Questions about the website files: see [README.md](#) inside the folder. Contact on the site: info@zmediage.com • +91 95268 40020.
